### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given by J. Bruce Schelkopf in Applicant's Election without traverse filed on October 10, 2002.

The application has been amended as follows: Please cancel claims 16-30.

#### *Allowable Subject Matter*

2. Claims 1-15 are allowed.

Schneider et al. clearly teaches the construction of an ultrasonic biometric imaging and identity verification system comprising:

- a direct current motor having a stator and a rotor, said stator fixed to a reference frame;

- a threaded shaft coupled to said rotor;

- a torsion spring disposed perpendicular to said axis of said threaded shaft, said torsion spring comprising a center portion coaxially attached to said threaded shaft and an outer portion attached to said reference frame, and stores rotational energy from DC motor when said DC motor rotates said threaded shaft in a first rotary direction, said torsion spring returning rotational energy to said shaft in a second rotary direction when said DC motor is un-energized.

Asai et al. teach the construction of a controller having a shaft coaxially coupled to a rotational shaft stop, said shaft stop having a first and second shaft stop surfaces, and a first and a second actuator stop, said first actuator stop contacting said first shaft stop surface in a first rotation position and said second actuator stop contacting said second shaft stop surface at a second rotation position, wherein a first and second force resulting from said first and second actuator stops contacting said first and second shaft stop surfaces, respectively, act tangential to a radius vector of said threaded shaft for the purpose of preventing a throttle valve from locking at its fully closed position.

Has teaches the construction of a rotating actuator having an elastic strip and a linear spring for the purpose of setting the flywheel and actuating element into movement through a defined free angle.

3. The following is an examiner's statement of reasons for allowance.

The prior art of record, taken alone or in combination, fails to teach the construction of a linear actuator as described on:

independent claim 1, comprising a translation actuator threadedly coupled to said threaded shaft, said translation actuator rotationally stopped and operable to laterally translate in response to rotation of said threaded shaft by said DC motor; and

independent claim 7, comprising a conversion means for converting rotation motion of said shaft to an actuator lateral translation motion.

Dependent claims 2-6 and 8-15 are considered allowable by their respective dependence on allowed independent claims 1 and 7.

Art Unit: 2834

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Conclusion***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892.
